

1    **ABSTRACT OF THE DISCLOSURE**

2           A headphone with an automatic reeling device for a jack wire has a  
3   headband with two earphones, a reeling device installed inside one of the two  
4   earphones and a jack wire. The reeling device has a stationary disk, a rotating  
5   disk with a wire reel rotatably abutting the stationary disk, a coil spring  
6   mounted between the stationary disk and the rotating disk and a push button  
7   detachable engaging the rotating disk. The jack wire is wound around the  
8   wire reel on the rotating disk. By pressing the push button, the rotating disk  
9   is released, and the coil spring provides a restitution force to rotate the  
10   rotating disk and retract the jack wire into the earphone.
